

PHOTOLUMINESCENCE SPECTRA
AND PHOTOCHEMISTRY OF ERBISOL

The own photoluminescence spectra of Erbisol preparation and its modifications (Extra Erbisol and Super Erbisol) have been measured at room temperature for the first time. It has been shown that they are all characterized by specific spectra of light emission. The preparations have been found to possess different photochemical stabilities to UV irradiation. The results obtained have been discussed, taking into account the technological features in the fabrication of preparations and their biological (medical) action on human organisms.
